

### GENERAL DESCRIPTION

The SGM8049-1, SGM8049-2 and SGM8049-4 micro power, low voltage operational amplifiers are designed for battery-powered applications. The amplifiers operate on a supply voltage as low as 1.8V ( $\pm 0.9V$ ). High-performance, single-supply operation with rail-to-rail capability makes the SGM8049-1/2/4 useful for a wide range of applications.

In addition of small packages, the SGM8049-1/2/4 feature impressive bandwidth, low bias current and low noise relative to the very low quiescent current.

The single SGM8049-1 is available in Green SC70-5, SOT-23-5 and TDFN-2 $\times$ 2-6L packages. The dual SGM8049-2 is available in Green SOT-23-8 and SOIC-8 packages. The quad SGM8049-4 is available in Green TSSOP-14 package. They are specified over the extended  $-40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$  temperature range.

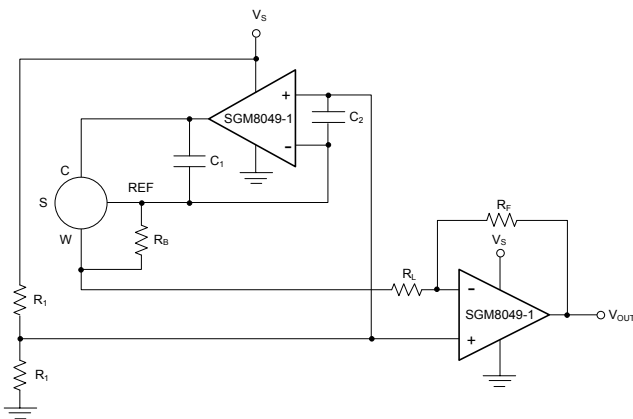

Figure 1. SGM8049-1 in Portable Gas Meter Application

### FEATURES

- **Low Noise:** 3.5 $\mu\text{V}_{\text{PP}}$  (0.1Hz to 10Hz)
- **Wide Supply Voltage Range:** 1.8V to 5.5V
- **Low Quiescent Current:** 2.5 $\mu\text{A}$ /Amplifier (TYP)
- **Low Offset Voltage:** 0.85mV (MAX)
- **DC Precision:**
  - CMRR: 100dB
  - PSRR: 2.5 $\mu\text{V}/\text{V}$
  - $A_{\text{OL}}$ : 118dB
- **$-40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$  Operating Temperature Range**
- **Small Packaging:**
  - SGM8049-1 Available in Green SC70-5, SOT-23-5 and TDFN-2 $\times$ 2-6L Packages
  - SGM8049-2 Available in Green SOT-23-8 and SOIC-8 Packages
  - SGM8049-4 Available in Green TSSOP-14 Package

### APPLICATIONS

- Battery-Powered Instruments
- Portable Devices
- Wearable Devices
- Medical Instruments
- Handheld Test Equipment

For example: SVAEA (2014, January)

**OVERSTRESS CAUTION**

Stresses beyond those listed may cause permanent damage to the device. Functional operation of the device at these or any other conditions beyond those indicated in the operational section of the specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

**ESD SENSITIVITY CAUTION**

This integrated circuit can be damaged by ESD if you don't pay attention to ESD protection. SGMICRO recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage. ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

**DISCLAIMER**

SG Micro Corp reserves the right to make any change in circuit design, specification or other related things if necessary without notice at any time.

**PIN CONFIGURATIONS**

## ELECTRICAL CHARACTERISTICS

## APPLICATION INFORMATION

The SGM8049-1/2/4 operational amplifiers minimize power consumption without compromising bandwidth or noise. Typical values of power supply rejection ratio (PSRR), common mode rejection ratio (CMRR), and open-loop gain ( $A_{OL}$ ) are 100dB or better.

When designing for ultra low power applications, choose system components carefully. To minimize current consumption, select large value resistors. Any resistors will react with stray capacitance in the circuit and the input capacitance of the operational amplifiers. These parasitic RC combinations can affect the stability of the overall system. A feedback capacitor may be required to assure stability and limit overshoot or gain peaking.

Good layout practice mandates the use of a 0.1µF bypass capacitor placed closely across the supply pins.

### Operating Voltage

SGM8049-1/2/4 operational amplifiers are fully specified and tested from +1.8V to +5.5V or ±0.9V to ±2.75V.

### Input Common Mode Voltage Range

The input common mode voltage range of the SGM8049-1/2/4 is from  $(-V_S) - 0.1V$  to  $(+V_S) + 0.1V$ . This rail-to-rail input is achieved using a complementary input stage. CMRR is specified from the negative rail to 1.2V below the positive rail. Between  $(-V_S) - 0.1V$  to  $(+V_S) + 0.1V$ , the amplifier operates with higher offset voltage because of the transition region of the input stage.

### Protecting Inputs from Over-Voltage

Normally, input currents are 1pA. However, a large voltage input (greater than 500mV beyond the supply rails) can cause excessive current to flow in or out of the input pins. Therefore, as well as keeping the input voltage below the maximum rating, it is also important to limit the input current to less than 10mA. This limiting is easily accomplished with an input voltage resistor, as shown in Figure 2.

**Figure 2. Input Current Protection for Voltages Exceeding the Supply Voltage**

### Noise

Although micro-power amplifiers frequently have high wideband noise, the SGM8049-1/2/4 offer excellent noise performance. Resistors should be chosen carefully because the SGM8049-1/2/4 have only 3.5µV<sub>PP</sub> of 0.1Hz to 10Hz noise, and 75nV/ $\sqrt{\text{Hz}}$  of wideband noise; otherwise, they can become the dominant source of noise.

### Capacitive Load and Stability

Follower configurations with load capacitance in excess of 30pF can produce extra overshoot and ringing in the output signal. Increasing the gain enhances the ability of the amplifier to drive greater capacitive loads. In unity-gain configurations, capacitive load drive can be improved by inserting a small (10Ω to 20Ω) resistor,  $R_S$ , in series with the output, as shown in Figure 3. This resistor significantly reduces ringing while maintaining direct current (DC) performance for purely capacitive loads. However, if there is a resistive load in parallel with the capacitive load, a voltage divider is created, introducing a DC error at the output and slightly reducing the output swing. The error introduced is proportional to the ratio  $R_S/R_L$ , and is generally negligible.

**Figure 3. Series Resistor in Unity-Gain Buffer Configuration Improves Capacitive Load Drive**

**APPLICATION INFORMATION (continued)**

In unity-gain inverting configuration, phase margin can be reduced by the reaction between the capacitance at the operational amplifier input and the gain setting resistors. Best performance is achieved by using smaller valued resistors. However, when large valued resistors cannot be avoided, a small (4pF to 6pF)

capacitor,  $C_{FB}$ , can be inserted in the feedback, as shown in Figure 4. This configuration significantly reduces overshoot by compensating the effect of capacitance,  $C_{IN}$ , which includes the amplifier input capacitance and printed circuit board (PCB) parasitic capacitance.

**Figure 4. Improving Stability for Large  $R_F$  and  $R_{IN}$**

Figure 5 through Figure 9 illustrate some low power application examples.

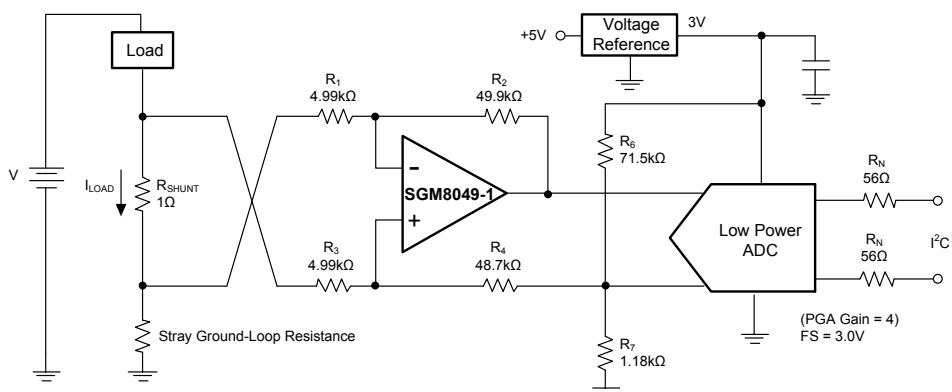

**Figure 5. Unipolar Signal Chain Configuration**

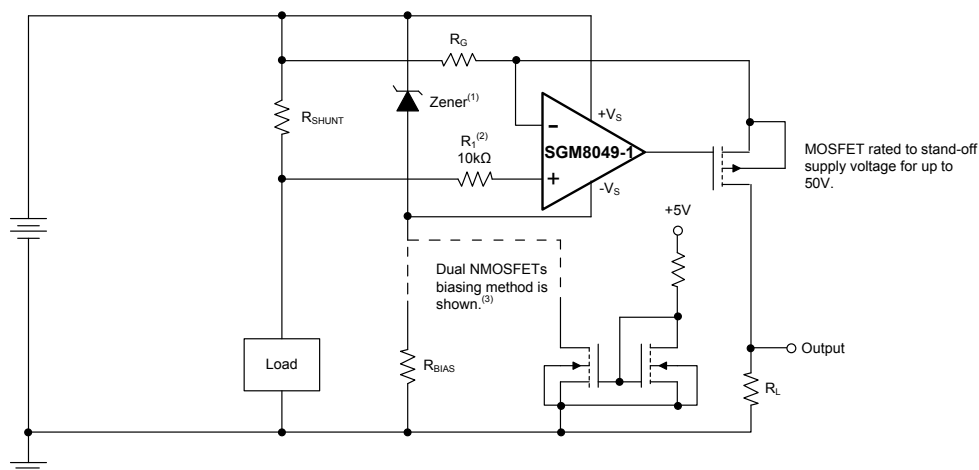

**Figure 6. Single Operational Amplifier Bridge Amplifier**

APPLICATION INFORMATION (continued)

NOTE: 1% resistors provide adequate common mode rejection at small ground-loop errors.

Figure 7. Low-side Current Shunt Monitor

NOTES:

1. Zener rated for operational amplifier supply capability (that is, 5.6V for SGM8049-1/2/4).
2. Current-limiting resistor.
3. Choose Zener biasing resistor or dual NMOSFETs.
